                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention provides a mutant antibody comprising a reactive site that is not present in the wild-type of the antibody. The antibody also has a complementarity determining region (CDR) that specifically binds to a metal chelate against which the wild-type antibody is raised. The cactive site of the mutant antibody is in a position proximate to or within the CDR, such that the chelate and the antibody are able to form a covalent bond. The present sequence is that of the light chain variable covalent bond. The present sequence is that of the light chain variable covalent bond. The present sequence of the invention, rational computer added design was used to develop an indium-EDTA chelate to covalently bind to CHA255 bund to a tumour and then to covalently attach the chelate to the antibody, thereby trapping it at the tumour site. This chalate to the antibody, thereby trapping it at the tumour site. This involved cloning the variable domains of CHA255 to construct a human/mouse chimeric Fab fragment that could be expressed in Escherichia coll, and the synthesis and screening of benzyl-EDTA chelates carrying vach, and the synthesis and screening of benzyl-EDTA chelates carrying vach, the special coll, and the synthesis and screening of conjugation of the antibody in vivo. This Fab can be conjugated to a targeting moiety when desired. A reactive site was incorporated into the antibody by engineering a Cys residue at location Asn-96 or Ser-95 of the light chain, near the region of the antibody to which the chelate bound. This was accomplished by site carricchelate antibody anulation of the wild-type of the anti-chelate antibody of a nucleic acid encoding the wild-type of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

complementarity determining region (CDR) that specifically binds to a metal chelate against which the wild-type antibody is raised. The creative site of the mutant antibody is in a position proximate to or within the CDR, such that the chelate and the antibody are able to form a covalent bond. The present sequence is that of the light chain of anticovalent bond. The present sequence is that of the light chain of anticovalent bond. The present sequence is that of the light chain of anticovalent bond computer-aided design was used to develop an indium-EDTA chelate to covalently bind to CHA255 in vivo. The premise was to allow the chelate to bind non-covalently to CHA255 bound to a tumour and then to covalently attach the chelate to the antibody, thereby trapping it at the tumour site. This involved cloning the variable could be expressed in Escherichia coli, and the synthesis and screening of benzyl-EDTA chelates carrying weakly electrophilic groups capable of conjugation of the antibody in vivo. This Fab can be conjugated to a targeting moiety when desired. A reactive site was incorporated into the antibody by engineering a Cys residue at location Asn-96 or Ser-95 of the light chain, near the region of the antibody to which the chelate bound. This was accomplished by site-directed mitagenesis of a nucleic acid antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      VPARFSGSLIGDKAALTITGAQTEDEARYFCALMYCNLWVFGGGTKLTVLSRTVAAPSVF 120

The invention provides a mutant antibody comprising a reactive site that is not present in the wild-type of the antibody. The antibody also has a complementarity determining region (CDR) that specifically binds to a metal chelate against which the wild-type antibody is raised. The complementarity determining region (CDR) that specifically binds to or within the CDR, such that the chelate and the antibody are able to form a covalent bond. The present sequence is that of the light chain variable contained bond. The present sequence is that of the light chain variable contained design was used to develop an indium-EDTA chelate to covalently bind to CHA255 in vivo. The premise was to allow the chelate to bind noncovalently to CHA255 bound to a tumour and then to covalently attach the covalently to CHA255 bound to a tumour and then to covalently attach the covalently to CHA255 bound to a tumour and then to covalently attach the covalently to CHA255 bound to a tumour and then to covalently attach the covalently and the spithesis and screening of CHA255 to construct a convalent contained to a transping it at the tumour site. This construct a nature of the antibody, thereby trapping it at the tumour site. This coll, and the spithesis and screening of CHA255 to construct a convalent could be expressed in Escherichia could, and the spithesis and screening of Denzyl-EDTA chelates carrying coll, and the spithesis and screening of penzyl-EDTA chelates carrying covic reactive site was incorporated into the antibody by engineering a Cys reactive site was incorporated into the antibody by engineering a Cys reactive site was incorporated into the antibody by site of the antibody to which the chelate bound. This was accomplished by site of the antibody to which the chelate bound. This was accomplished by site of the antibody to which the chelate bound. This was accomplished by site of the antibody to which the chelate bound and the coding the region of the antibody to which the relate belong the coding the coding the relate boun

Specifically, it refers to an antibody that comprises a metal chelate bound to an antigen recognition domain, where the metal chelate has a reactive functional group of complementary reactivity to the reactive site of the antibody. This reactive site is the side chain of a maturally occurring amino acid e.g. the -SH group side chain of a cysteine residue (not present in the wild type) which can be used to form a covalent bond between the reactive site of the antibody and the

reactive functional group of the metal chelate. The present invention describes using these antibodies for in vivo imaging where the antibody comprises a targeting molety that binds specifically to a cell via a cell surface receptor or antigen thus forming a cell-mutant antibody complex. On addition of the metal chelate, a cell-antibody-metal chelate complex. Is formed that can be detected using emission tomography, magnetic resonance imaging, lanthanide luminescence, gamma-emissions or single photon emission tomography (SPET). As such, this method is useful for treating a subject with cancer and pharmaceutical compositions exhibit cytostatic and immunosuppressive activities. This polypeptide sequence is the chimeric mutine antibody 2012.5 variable light chain protein fused to the human anti-tetanus toxin antibody kappa light chain constant region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   120

chelating agents and metal chelates, particularly macrocyclic metal chelates. Specifically, it refers to an antibody that comprises a metal chelates becidically, it refers to an antibody that comprises a metal chelate bound to an antigen recognition domain, where the metal chelate chelate bound to an antigen recognition domain, where the metal chelate cactive site of the antibody. This reactive site is the side chain of a reactive site of the antibody. This reactive site is the side chain of a caturally occurring amino acid e.g. the -SH group side chain of a caturally occurring amino acid e.g. the -SH group side chain of a covalent bond between the reactive site of the antibody and the a covalent bond between the reactive site of the antibody and the cactive functional group of the metal chelate. The present invention cantiger exceptor or antigen thus forming a cell-mutant antibody complex. On addition of the metal chelate, a cell-antibody-metal chelate complex is formed that can be detected using emission tomography, magnetic resonance imaging, lanthanide luminescence, gamma-emissions or single photon emission tomography (SPET). As such, this method is useful for treating a subject with cancer and pharmaceutical compositions exhibit cytostatic and immunosuppressive activities. This polypeptide sequence is the chimeric mutant N33C murine antibody 2D12.5 variable light chain
                                                                                                                                                                       el mutant antibody comprising reactive site not present in wild-type antibody and antigen recognition domain that recognizes macrocyclic al chelate having four nitrogen atoms, useful for treating cancer or
                                                                                                                                                                                                                                                                                                                                                            invention relates to multi-functional antibodies that recognise
                                                                                                                                                                                                                                                                                                       Claim 41; SEQ ID NO 28; 208pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     constant region of the invention.

Human CD72-targeted IgG1 light chain. XXXXXXXXXXXX

Human, CD72, B-lymphocyte; receptor; scFv; antibody; cytostatic; immunosuppressive; cancer; autoimmune disease; gene therapy.

New internalizing human binding molecules capable of specifically binding to CD72, useful for diagnosing and/or treating B-cell associated diseases, such as cancer or autoimmune disorders. Example 5; SEQ ID NO 54; 174pp; English Location/Qualifiers 1. .109 /label= V_region 110. .215 /label= C_region 27-JAN-2003; 2003WO-EP050004 27-JAN-2003; 2003WO-EP050004 (CRUC-) CRUCELL HOLLAND BV. The present sequence is the protein sequence to the injuriant of antigen CD72. An acry was shown to specifically recognises human B cell associated antigen CD72. An acry was shown to specifically recognise the human CD72 receptor. The acry was recloned in IgG expression vector C01 using primers designed to restore complete human frameworks, thereby generating antibody 025. Such anti-CD72 immunoglobulins or their antigen-binding fragments can be used as internalising human binding molecules of the invention. These internalising human binding molecules of the invention. These conternalising human binding molecules of the invention to the surface of binding to CD72 or its antigenic determinant, and preferably bind to CD72 binding to CD72 present on the surface of casociated with cells. Upon binding to CD72 present on the surface of trarget cells, the binding molecules, the invention provides internalising human binding molecules, the invention provides comprising an internalising mean of casociated with compositions compositions compositions compositions composition of internalising human binding molecule, immunoconjugate, nucleic acids encoding these, and compositions comprising them. The internalising human binding molecule, immunoconjugate, nucleic acids encoding these, and compositions composition can be used in the diagnosis and/or treatment of a B cell associated disorder or disease, especially a B cell associated cancer and B cell associated autoimmune disorder (claimed). present sequence is the protein sequence of the light chain of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to domain deleted CC49 or C2BB antibodies.

Domain deleted CC49 antibodies comprise a heavy chain human CC49 domain deleted sequence in which CL12 domain has been deleted and are reactive with tumour associated antigen (TAG)-72. The C2BB antibodies are reactive with tumour associated antigen (TAG)-72. The C2BB antibodies are reactive with CD20 and comprise a heavy chain having a sequence of a derived domain deleted C2BB construct where the CH2 domain has been deleted.

Sequences of the invention are useful for imaging a neoplasm. They are also useful for treating myelosuppressed patients suffering from neoplastic disorder such as haematologic neoplasm, preferably non-coplastic disorder, colon cancer and haematologic malignancy. They are useful for reducing tumour size, inhibiting tumour growth and/or treating tumours. The present sequence is human C2BB light chain protein. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ñ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel domain deleted CC49 antibody reactive with tumor associated antigen -72, or C2B8 antibody reactive with CD20, useful for treating myelosuppressed patient suffering from a neoplastic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  28

monomeric subunits, where the monomeric subunits are non-covalently associated. (I) is useful for treating a disorder, especially immune disorder, and neoplastic disorder such as relapsed Hodgkin's disease.

resistant Hodgkin's disease high grade, low grade and intermediate grade non-Hodgkin's lymphomas. B cell chronic lymphocytic leukemia (B-CLL). lymphoplasmacytoid lymphoma (LPL), mantle cell lymphoma (MCL), follicular lymphoma (EL), diffuse large cell lymphoma (DCL), Burkitt's lymphoma (BCL), diffuse large cell lymphoma, angioimmunoblastic lymphoma (BCL), and lymphocytic, follicular, diffuse large cell, diffuse small cleaved cell, and non-Burkitt's follicular, mixed small cleaved burkitt's and non-Burkitt's follicular, mixed small cleaved cell lymphomas, in a mammal (see ABZ24017 for a represents the antibody C2B8 light chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel dimeric antibody useful for treating immune disorder and neoplastic disorder, has several non-covalently associated monomeric subunits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             77 SGVPVRFSGSGSGTSYSLTISRVEAEDAATYYCQQWTSNPPTFGGGTKLEI-KRTVAAPS 135

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence is used in a method for obtaining a novel gene construct (A) which expresses, in cells of a mammal, a conjugate (B) of a cell-targeting group (I) and a heterologous prodrug-converting enzyme (II), and (B) is directed to leave the cell for selective localisation at a cell surface antigen (Ag) recognised by (I). Delivery of (A) to a target site, then administration of (III) is used for targeted release of cytotoxic drug, specifically for treating cancer but also inflammation such as rheumatoid arthritis. In situ generation of the targeting antibody increases selectivity, reducing side effects at normal tissue. The method is applicable to any antibody-directed enzyme prodrug therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New gene construct expressing conjugate of targetting agent and prodrug-
converting enzyme - useful for, e.g. targetted production of cytotoxic
drug in vivo, especially for treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ARESGSLIGDKAALTITGAQTEDEARYFCALWYCNLWVFGGGTKLTVLSRTVAAPSVFIF

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an antibody comprising an Fc variant portion having an amino acid modification in the Fc region of the parent Fc polypeptide, where the Fc variant modulates binding to an Fc-gamma-R compared to the parent Fc polypeptide. The antibody may also be used in research and in agricultural or industrial applications. This sequence corresponds to the light chain of the antibody "Rituximab" as an example
                                                                                                                                                                                                                                                                                                                                                                                                antiinflammatory; cardiovascular; gene therapy; antibody; Fc;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a dimeric anti-CD20 light chain polypeptide. The dimeric immunoglobulin is used in the method of the invention. The specification describes a method for producing an immunoglobulin (Ig) G/IgG dimer. The method comprises genetically espicially formation of intramolecular disulphide bridges between sister heavy. Chains on the same antibody to introduce a cysteine molecule which inhibits formation of intramolecular disulphide bridges between sister heavy. Chains on the same antibody molecule. The dimer is a homodimer or heterodimer that is capable of activating components of the complement cascade. The dimer is also capable of binding to Fcgamma receptors on cytocoxic effector cells and on host immune cells, and is capable of initiating programmed cell death. The IgG/IG dimers may be used to treat allergic disorders, cancers and autoimmune diseases such as allergic asthma, allergic bronchopulmonary aspergillosis, allergic rhinitis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               complement system; Fcgamma receptor; cytotoxic effector cell; boost immune cell; programmed cell death; allergic disorder; cancer; autoimmune disease; allergic asthma; atopic dermatitis; Crohn's disease; allergic bronchopulmonary aspergillosis; allergic rhinitis; Graves's disease; food allergy; allergic contact dermatitis; cancer; becall imphoma; rheumatoid arthritis; ulcerative colitis; psoriasis; pigeon breeder's disease; hepatitis; leprosy; Lyme disease; disease; aplastic anaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             "murine anti-human CD20 variable light chain"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ly engineering immunoglobulin (Ig) G/IgG dimers for the of cancers, allergic disorders and autoimmune conditions.

```
allergic contact dermatitis, CLL cancers and/or B-cell lymphomas. They may also be used to treat a range of other diseases and disorders such as rhemmatoid arthritis, ulerative colitis, psoriasis, pigeon breeder's disease, hepatitis, leprosy, Lyme disease, diabetes mellitus, candidiasis and aplastic anaemia. They are also useful for inducing hyper-cross-linking of membrane antigens and for the preferential killing of selected cell populations. (Updated on 12-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      178

specific humanised antibody called BIWA8 and BIWA4. Sequences of the invention are useful for manufacturing a medicament and for treating cancer including colorectum, non-small cell lung, breast, head and neck, ovariam, lung, bladder, pancreatic cancer or metastatic cancers of the brain. They are also useful in antibody therapy. The present sequence is BIWA4/8 antibody light chain mature protein. This sequence is used in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              28
chemotherapeutic agent. The method of the invention has cytostatic chemotherapeutic agent. The method of the invention has cytostatic chemotherapeutic agent. The method of the invention has cytostatic compositions and may be useful in the preparation of a pharmaceutical composition for the treatment of cancer, particularly head and neck aquamous cell carcinoma, estin squamous cell carcinoma, skin squamous cell carcinoma, skin squamous cell carcinoma, skin squamous cell carcinoma, breast adenocarcinoma, lung adenocarcinoma, pancreas adenocarcinoma, colon adenocarcinoma and stomach adenocarcinoma. The current sequence is that of the humanised murine antibody BIWAB light

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a compound comprising CD44 specific antibody molecule conjugated to a highly cytotoxic drug, which cleaves under intracellular conditions. The compound is used in pharmaceutical composition for the treatment of cancer, solid tumours, and as an adjuvant to surgical intervention to treat minimal residual disease. The present sequence is humanised murine antibody BIWA4 light chain protein
                                                                                                                                                                                                                                                                                                                                                                                                                                     New compound useful for treatment of cancer comprises CD44 specific antibody molecule conjugated to a highly cytotoxic drug, which cleaves under intracellular conditions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     õ
                                                                           The present invention describes using a compound (CD) of formula A(LB)n, where A is an antibody molecule which is specific for CD44, L is a linker molecy. B is a compound which is toxic to cells, and n is a decimal number between 1-10, for the preparation of a pharmaceutical composition for the treatment of cancer, where CD is used or is for use in combination with radiotherapy. Also described: (1) use of a conjugate (CJ) of a CD44v6 specific antibody molecule and a maytansinoid for the manufacture of a pharmaceutical composition for the treatment of cancer, where CJ is used or is for use in combination with radiotherapy; (2) a pharmaceutical composition for the treatment of cancer, where CD is used or is for use in comprising CD or CJ rogether with a radioimmunotherapeutic agent and optionally further comprising on or more carrier(s), diluent(s), or excipient(s); (3) a kit comprising in a composition for the preparation of a pharmaceutical composition for the cradioimmunotherapeutic agent; and (4) use of radioimmunotherapeutic agent; and (4) use of radioimmunotherapeutic agent; of a pharmaceutical composition for the cradioimmunotherapeutic agent; where the radioimmunotherapeutic agent is used or is consument of anner, where the radioimmunotherapeutic agent is used or is consument of amedicament for the treatment of cancer, where the radioimmunostimulators. CJ is useful for the squamous cell carcinoma, breast adenocarcinoma, lung adenocarcinoma, pancreas adenocarcinoma, colon adenocarcinoma, lung adenocarcinoma, pancreas adenocarcinoma, colon adenocarcinoma, lung adenocarcinoma, pancreas adenocarcinoma, into adenocarcinoma, and stoment of cancer. CD and CJ are useful for treating cancer in a compination with radiotherapy. CD and CJ are useful as an adjuvant to surgical interaction, to treat minimal residual disease. The present compination with radiotherapy, CD and CJ are useful disease. The present compination in the axemplification of a parageral interaction, to treat minimal residual disease. The present is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       <u>ښ</u>

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
